

Realm Networks

Dynamic DNS

Dynamic DNS is used when you do not have a static IP address for your server, this is so you can still use the full functionality of the server. The providers listed for this service are under Network Services then DNS.

You can use either www.no-ip.com or www.dyndns.com and when you enter the information provided by these sites into the DNS section of the server it will update your DNS records for your domain automatically so outside users can still reach your domain.

This allows use of the following services without having a static IP address:

- WWW: Your website.
- SMTP/POP3/IMAP: Your mail servers.
- FTP: Your FTP server.
- VPN: Raming users who can't always find out about your current IP address.
- LDAP: To connect to the directory service.
- VOIP: Roaming users using Soft-Phones or IP Phones remotely.
- Administration / Members Sections: admin and members.yourcompany.com can be accessed.
